Interalia Systems Corp monitoring and diagnostic solutions minimize resources required by public transport authorities to operate and maintain their fleets. It continuously monitors, logs and reports the status of equipment on its network and can report pertinent information to a central diagnostics controller over standard IEEE 1473 networks.

Interalia Systems Corp also provides a complete diagnostic package for the train based on its cost-effective IP network. This consists of a train-wide redundant, high-reliability, high-availability network with system-wide access to transit facilities, systems and equipment. It provides the complete picture needed for effective asset management and streamlined maintenance.

Monitoring and Diagnostic features include:

- Heartbeat monitoring of network clients, including third-party equipment
- Gateway access to standard IEEE 1473 Type L and Type T networks for third-party equipment
- Single-point access to update software and databases for train equipment
- Interoperability with IEEE wireless IP technologies (Wi-Fi and Wi-Max) and standards to support remote access to train equipment and data
- Proven technology
- Certification according to railway IEC standards
